Artificial Intelligence in Construction Engineering and Management Limao Zhang 2021-06-18 This book highlights the latest technologies and applications of Artificial Intelligence (AI) in the domain of construction engineering and management. The construction industry worldwide has been a late bloomer to adopting digital technology, where construction projects are predominantly managed with a heavy reliance on the knowledge and experience of construction professionals. AI works by combining large amounts of data with fast, iterative processing, and intelligent algorithms (e.g., neural networks, process mining, and deep learning), allowing the computer to learn automatically from patterns or features in the data. It provides a wide range of solutions to address many challenging construction problems, such as knowledge discovery, risk estimates, root cause analysis, damage assessment and prediction, and defect

detection. A tremendous transformation has taken place in the past years with the emerging applications of AI. This enables industrial participants to operate projects more efficiently and safely, not only increasing the automation and productivity in construction but also enhancing the competitiveness globally.

Building Tomorrow: Innovation in Construction and Engineering André Manseau 2019-09-16 In the past decade construction and engineering have changed dramatically, with an explosion of innovative new approaches to construction and new methodologies. By bringing together economic, social and construction/engineering management perspectives, this book offers a unique and comprehensive survey of these approaches and techniques. It presents a history of studies in innovation in construction and engineering, and then presents the most recent models of innovation brokering and risk-management, based on complex project-based industries. Innovation is defined and competing theories are discussed in the light of operational issues. The book covers all aspects, including the importance of construction and engineering 'cultures' in the trades for successful project innovation. It also discusses the role of government and policy makers, the implications of rapid change for the building trades and skilled labour, and the difficulty of measuring innovation quantitatively.

Civil Engineering in Context Alan Muir Wood 2004 Sir Alan Muir Wood sits in the pantheon of great civil engineers of the twentieth century. In Civil Engineering in Context, Sir Alan Muir Wood draws from his long career to place as he says 'civil engineering in context'. The book contains many personal reminiscences of his life as an engineer from early days as a wartime marine engineer in the Royal Navy, through his more than 25 year career as a Partner and Senior Partner with Halcrow and as a tunnelling engineer of world renown. Civil Engineering in Context also presents Sir

Alan's strongly held and sometimes controversial views on how civil engineering as an industry has developed since the pragmatic enterprise of the nineteenth century, through a twentieth century where much of the momentum was lost, and how it should be developing in the twenty-first century. Sir Alan ranges across many topics which directly affect the role of the engineer, including management and the law, systems and design, and ethics and politics. He also discusses his contribution and the wider aspects to some of the major projects of the twentieth century such as the Channel Tunnel. *Civil Engineering in Context* provides an enlightening insight into the civil engineer and civil engineering through the eyes of one of its most eminent protagonists.

Physical Models Bill Addis 2020-11-02 Physical models have been, and continue to be used by engineers when faced with unprecedented challenges, when engineering science has been non-existent or inadequate, and in any other situation when the engineer has needed to raise their confidence in a design proposal to a sufficient level to begin construction. For this reason, models have mostly been used by designers and constructors of highly innovative projects, when previous experience has not been available. The book covers the history of using of physical models in the design and development of civil and building engineering projects including bridges in the mid-18th century, William Fairbairn's Britannia bridge in the 1840s, the masonry Aswan Dam in the 1890s, concrete dams in the 1920s, thin concrete shell roofs and the dynamic behaviour of tall buildings in earthquakes from the 1930s, tidal flow in estuaries and the acoustics of concert halls from the 1950s, and cable-net and membrane structures in the 1960s. Traditionally, progress in engineering has been attributed to the creation and use of engineering science, the understanding materials properties and the development of new construction methods. The book argues that the use of reduced scale models have played an equally important part in the development of civil and building engineering. However, like the history of engineering design itself, this crucial contribution has not been widely reported or celebrated. The book concludes with reviews of the current use of physical models alongside computer models, for example, in boundary layer wind tunnels, room acoustics, seismic engineering, hydrology, and air flow in buildings.

Seismic Vulnerability Assessment of Civil Engineering Structures at Multiple Scales
Tiago Miguel Ferreira 2021-12-08 Seismic Vulnerability Assessment of Civil Engineering Structures at Multiple Scales: From Single Buildings to Large-Scale Assessment provides an integrated, multiscale platform for fundamental and applied studies on the seismic vulnerability assessment of civil engineering structures, including buildings with different materials and building typologies. The book shows how various outputs obtained from different scales and layers of assessment (from building scale to the urban area) can be used to outline and implement effective risk mitigation, response and recovery strategies. In addition, it highlights how significant advances in earthquake engineering research have been achieved with the rise of new technologies and techniques. The wide variety of construction and structural systems associated with the complex behavior of their materials significantly limits the application of current codes and building standards to the existing building stock, hence this book is a welcomed guide on new construction standards and practices. Provides the theoretical backgrounds on the most advanced seismic vulnerability assessment approaches at different scales and for most common building typologies Covers the most common building typologies and the materials they are made from, such as concrete, masonry, steel, timber and raw earth Presents practical guidelines on how the outputs coming from such approaches can be used to outline effective risk mitigation and emergency planning strategies

An Investigation Into Current Construction Engineering and Management Programs and Curricula and Their Applicability to the U.S. Armed Forces Brad Beisswanger 1988
The purpose of this paper is to research and explore the available programs and curricula in Construction Engineering and Management and assess their applicability to the needs of the civil engineering segments of the U.S. Armed Forces. The writer's interest in this subject was piqued by discussions with fellow officers who had attended various institutions for similar programs. Opinions and levels of satisfaction with the programs seemed to vary widely, yet no apparent action had been taken to guide potential students to the more gratifying and appropriate schools. To identify the need for construction engineering and management, a short history of construction education is presented. Turning next to industry's desires, an examination of what the construction industry is looking for from construction education is made. Looking then from the other side of the fence, and explanation of what the industry can provide the educational establishment of further promote the field is given. In order to better understand what the military civil engineer needs in an education, a synopsis of duties and functions of each service (Army, Navy, and Air Force) is provided. A comparison of the tasks performed and educational programs available is presented. (kr).

Construction in the Landscape Carpenter T.G. 2012-06-25
Construction in the Landscape describes the impact of construction on the land and landscape where it takes place. Geographical coverage is necessarily global to reflect the great variation both in people's economic and social needs and in the shortage or abundance of natural resources. Part I introduces both land resources, whether used for agriculture,

human settlement or mineral extraction or conserved as scenery, wildlife habitat or for the undefined needs of future generations; and construction, its products, skills, processes and impacts on land resources. Part II describes specific forms of civil engineering - from landform adaptation, through dams and river control works, coastal construction and transport infrastructure to particular types of structure such as bridges, towers and power stations, or the layout of complete settlements. Part III deals with regional planning of construction and land use in different geographical circumstances - from fine scenery, through rural countryside to city and suburban development - and to the sort of land arrangements that may be sustainable for an increased but hopefully more civilized human population a century hence.

Perspectives in Civil Engineering Jeffrey S. Russell 2003-01-01 This report contains 27 papers that serve as a testament to the state-of-the-art of civil engineering at the outset of the 21st century, as well as to commemorate the ASCE's Sesquicentennial. Written by the leading practitioners, educators, and researchers of civil engineering, each of these peer-reviewed papers explores a particular aspect of civil engineering knowledge and practice. Each paper explores the development of a particular civil engineering specialty, including milestones and future barriers, constraints, and opportunities. The papers celebrate the history, heritage, and accomplishments of the profession in all facets of practice, including construction facilities, special structures, engineering mechanics, surveying and mapping, irrigation and water quality, forensics, computing, materials, geotechnical engineering, hydraulic engineering, and transportation engineering. While each paper is unique, collectively they provide a snapshot of the profession while offering thoughtful predictions of likely developments in the years to come. Together the papers illuminate the mounting complexity facing civil engineering stemming from rapid growth in scientific knowledge, technological development, and human populations, especially in the last 50 years. An overarching theme is the need for systems-level approaches and consideration from undergraduate education through advanced engineering materials, processes, technologies, and design methods and tools. These papers speak to the need for civil engineers of all specialties to recognize and embrace the growing interconnectedness of the global infrastructure, economy, society, and the need to work for more sustainable, life-cycle-oriented solutions. While embracing the past and the present, the papers collected here clearly have an eye on the future needs of ASCE and the civil engineering profession.
